I think there needs to be a rule out in place that water can only be traded once before it has to be used to irrigate. This in true would remove speculators. Now in saying that. It would be the same for a farmer as well. If a farmer reckon he needs 100 megs and only uses 50. He can either carry that over. Or he looses it. Having this would in turn return more water to an allocation for the nexted season and environment
